NII = (4+1+5+2+2+4) 16=3

面计算名用户与用户与的相加度,找出 2-最近金月, $(2-\frac{4}{2})(2-3.5)+(1-\frac{4}{2})(3-3.5)$ $\sqrt{(\frac{1}{2})^2+(\frac{1}{2})^2}$ 七

 $Sim(2.5) = \frac{(4-3)(2-35)+(2-3)(5-35)}{1^2+1^2} = -0.949$

 $\sin(3.5) = \frac{(4-3.8)(5-3.5) + (4-3.8)(4-3.5) + (3-3.8)(3-3.5)}{\int_{0.8^2 + 1.2^2 + 0.2^2 + 0.2^2 + 0.8^2} t} = 0.2|4$

说 t=\n52+ n52+ n52+0152

μι = (3+5) 12 =4

$$sim_{(4,5)} = \frac{(1-\frac{3}{3})(2-35)+(3-\frac{3}{2})(4-35)}{\int (\frac{4}{5})^2+(\frac{5}{3})^3} + \frac{1}{5}$$

$$sim_{(5,5)} = \frac{(2-35)(4-35)}{\int (5^2+1)^2} + \frac{1}{5}$$

$$sim_{(7,5)} = \frac{(1-35)(2-35)}{\int (5^2+1)^2} + \frac{1}{5}$$

$$sim_{(7,5)} = \frac{(1-35)(5-35)}{\int (5^2+1)^2} + \frac{1}{5}$$

$$sim_{(8,5)} = \frac{(4-35)(5-35)}{\int (5-35)} = 0.632$$

$$sim_{(9,5)} = \frac{(4-35)(2-35)}{\int (5-35)(2-35)} = 0.632$$

$$sim_{(9,5)} = \frac{(3-25)(2-35)}{\int (5-35)(2-35)} = 0.632$$

$$sim_{(11,15)} = \frac{(5-3)(2-35)+(2-35)(5-35)+(2-35)(4-35)+(4-3)(335)}{\int (2^2+2^2+2^2+1^2+1^2+1^2)} + \frac{1}{5}$$

$$= -0.7|0$$

$$sim_{(12,5)} = \frac{(5-4)(4-35)}{\int (2^2+2^2+2^2+1^2+1^2+1^2)} + \frac{1}{5}$$

$$im_{(11,15)} = \frac{(5-4)(4-35)}{\int (2^2+2^2+2^2+1^2+1^2+1^2)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (5-3)(2-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (2^2+2^2+2^2+1^2+1^2+1^2)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (4-35)(2-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (2-35)(2-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (5-35)(2-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (5-3)(4-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (5-3)(4-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (5-3)(4-35)(4-35)} + \frac{1}{5}$$

$$im_{(12,5)} = \frac{(5-4)(4-35)}{\int (5-3)(4-35)(4-35)} +$$

- 2 问答题(言之有理即可)
- 2.1 社团推荐是社会网络分析中常见的问题。在仅考虑网络结构的情况下,已知网络中存在的若干社团,请结合课程内容中所介绍的推荐技术(包括链接推荐技术)与社团挖掘技术,设计一种给指定节点推荐社团的方法,并简述你的理由。

首先采用基于聚类的方法,用Q-Modularity指标确定合适的社团数,然后采用层次聚类或划分聚类的方法,将网络分为不同的社团,此时被指定的节点会被划分到某个社团中,则这个社团可以作为推荐。然后基于链接预测技术,预测该节点可能和哪些其他节点间存在边,并结合已有的边,推荐这些邻居(包括直接邻居和可能的邻居)所处的社团。这样,被推荐的社团都和该节点存在一定关联,推荐较为合理
